

MacBone MH16-5 Updates

- Revised electrical system with the voltage selector assembly (E8000-01-A) to allow for automatic switching for 12 or 24vdc power.
- Optional P150V-1 cab pressureizer may be used with the MH16-5.
- A condensate removal system eliminating drain hoses and reducing installation time comes standard on all MH16-5 units. Condensation droplets are discharged out the condenser blower with warm air. The unit may still be modified to use the optional tube type condensation removal.
- A thicker 1" filter material is installed in drain pan to prevent condensation water from being pulled into the evaporator blower.
- To prevent the hydraulic control rod coupling set screw from loosening, a longer set screw with knurled end has been implemented.
- To prevent the fan coupling set screw from shearing, a keyway and longer set screw is being utilized.
